1 Introduction

Thank you for purchasing the **Day and Night Cycle** asset.

This package allows you to easily simulate a full day/night lighting cycle in your Unity scene. The sun and moon are managed automatically through an intuitive script, fully customizable.

2 Package Contents

- ☒ Prefabs:
 - Sun (Directional Light)
 - Moon (Directional Light)
- ☒ Scripts:
 - `CycleManager.cs` (Core day/night control)
- ☒ Demo Scene:
 - `DayNightDemo.unity`

- ☒ Documentation

3 Installation Instructions

1. Open your Unity project.
2. Import the asset package (`DayNightCycle.unitypackage`) into your project.
3. Find the asset under:

```
swift
CopyEdit
Assets/AIKStudio/DayNightCycle/
```

4. Open the demo scene to preview functionality.
-

4 Getting Started

To add the Day/Night Cycle into your own scene:

- Drag the **CycleManager** script onto an empty GameObject.
 - Assign the Sun and Moon directional lights into the script's inspector fields.
 - Adjust settings such as:
 - **Current Time** (starting time of the cycle)
 - **Time Speed** (speed of time progression)
 - **Light Settings** (color, intensity, flare, etc.)
-

5 Inspector and Parameters

Parameter	Description
Current Time	Float (0 to 24), sets initial time of day
Time Speed	Controls how fast time progresses
Sun Light	Reference to your Sun (Directional Light)
Moon Light	Reference to your Moon (Directional Light)

Note: You can further modify sun & moon color, intensity, and temperature using Unity's default light component.

6 Demo Scene

- The included demo scene (`DayNightDemo.unity`) demonstrates the system in action.
 - You can use it as a starting template for your project.
-

7 Performance Tips

- Keep light baking disabled if using real-time lights.
 - Use optimized shadow settings for mobile platforms.
 - Keep time speed reasonable to avoid lighting popping due to fast rotations.
-
